Creative workspaces, built for the work.

A responsive mockup implementation and an original professional image workspace, built with Next.js and a mocked generation API.

01 / PART A

Mockup implementation

A close responsive recreation of the supplied light generation page, including history, controls, results, detail views, and feedback states.

02 / PART B

The decision trail

An original workspace for returning creators: a large active frame, a focused composer, two-up comparison, and a record of the intent behind each output.

PRODUCT THINKING

Designing for continuity

Part B / Image Generation Workspace

1 / PROBLEM AND USER

A professional creator returning to an active campaign needs to remember why a direction worked and what changed between iterations. Most generation feeds keep the pixels but lose that context.

2 / THREE UX DECISIONS

Keep the frame large: judgment belongs at the center. Bind context to output: each result carries its prompt, direction, and frame. Compare only two: a pair supports a concrete decision without a crowded asset manager.

3 / FEATURES LEFT OUT

I left out model marketplaces, social discovery, node graphs, and deep preset catalogs. They would distract from the core job: developing and evaluating a visual direction. The mock API is explicitly labeled as a demo.

4 / INSPIRATION AND IMPROVEMENT

Krea informed the prompt-centered flow, Higgsfield the immersive review, and Magnific the visible professional controls. I added continuity: an earlier idea can be reopened with its intent and settings intact.

5 / ANOTHER MONTH

I would connect real image and video services with progress, cancellation, and recovery; validate the decision trail with art directors; and add durable projects, team annotations, and stronger reference handling.

6 / DIFFERENTIATING WORKFLOW

The decision trail turns history into an active creative tool. Selecting an output restores the thinking behind it as a starting point for the next exploration, rather than leaving it as another tile in a feed.
